

Weekly Project Report

Risk Status Report

- Last week I identified a new risk that I believe is at the core of the entire research, namely that we don't come up with a standardized & accurate method to weigh rules. (Regardless of how much I like it) philosophy isn't really my field of expertise, and I don't know how the academic approach has towards it. I don't know if we will be able to find papers on logic and such, or if that falls more into mathematics. We may really be the first ones trying to find a "scientific" categorization of logical rules (!), and we'll have to be really careful.
- Another new risk: as I started organizing my thoughts in a Research Design Document, I started facing the risk of working from an entirely different paradigm. When you're inside a paradigm, you present one new discovery "standing on the shoulders of giants", but we have no giants to stand on, our assumptions (eg. that raising PTL is a leverage point from a root cause) haven't been proved and accepted by the scientific community out there. I've come up with a couple ideas for solutions, but it is important to keep that in mind.
- A possible & simple solution for measuring the tool's validity would be to claim check made up lies, or facts accepted by scientific consensus.
- Great news! I finally finished reading the entire FC WT Slack Channel. Jimmy Wales seems to think very much in line with what we're doing. I want to contact him ASAP, I consider we're getting close to the ideal point to contact him, and preparing our first approach will be a priority of mine this week.
- Last week I started following some relevant accounts on our new Twitter account, but I haven't tweeted anything yet. Looking forward to start doing that this week.

Schedule Status Report

- This week I feel that I am behind schedule, because by this point I planned on having everything needed for experiment 1 ready, but that's not the case. Good progress has been made, but I won't consider the job done, until it is all clear and without gaps on a document. I've started that document, and it is going well. I expect once that is done for the first experiment, I won't need as long for designing the second one, so I hope to be able to complete that together with the tasks of this week, by the end of this week.

- I attribute the cause of this happening to the nature of our discovering work. I spent one entire day having deep philosophical questionings that originated from designing the hypotheses. That was necessary, but unexpected.
- The training with the tool went amazingly well. The timing of doing that while designing our hypotheses was perfect. Now I feel I *really* understand the tool, and could even teach others how to use it.

Areas I need help on

- Soon we'll need to start working on the guidelines of how we'll pick the FC articles that we're going to claim-check. That's something we could think about together.
- We planned that Jack will be the one who creates the online questionnaire. For this I have some feedback based on the online questionnaires he did before starting with this project. I haven't posted that on the forum, but I definitely will this week!
- Feedback on the Research Design document, once it's finished, will be very helpful!

Goals for the coming week

- Finish Research Design documents for experiment 1 & 2
- Work on 1st approach to Jimmy Wales
- Start using our Twitter account
- Post my feedback on online questionnaires on the forum
- I still haven't created a forum thread on the CC-accuracy project... my bad, I was consumed into other things this last week.
